Project Overview (Bet Evaluation System)

- Core domain classes:
  - Bet represents a sportsbook bet
  - It stores objects for:
    - Team
    - Prop
    - Odds
  - Prediction represents the expected probability
  - Prop interface stores different bet types:
    - Moneyline
    - Spread
    - OverUnder
  - Every bet is identified by its team and prop turned into string
- Implemented logic to calculate expected value (EV / edge):
  - Compares prediction probability vs sportsbook odds
  - Stores results as a grade on each bet
- Bet implements Comparable:
  - Allows sorting bets by value
  - Enables use in priority queues (heaps)
- BetEvaluator manages everything:
  - Stores all bets and predictions in HashMaps
  - Uses a PriorityQueue to rank bets by best value
  - Also stores heaps for filtered search of bets:
    - by team
    - by sportsbook
    - by prop type
- Implemented methods to retrieve:
  - Top N bets overall
  - Top N bets by team
  - Top N bets by sportsbook
  - Top N bets by prop
- Added JSON support using Gson:
  - Deserialize incoming bets and predictions
    - Assumes the json file fits our bet objects
  - Automatically process and compare them
